#### Product summary

|            |               |
|------------|---------------|
| Order code | BlueNRG-332xy |
|------------|---------------|

- Bluetooth Low Energy system-on-chip supporting Bluetooth 5.3 specifications
  - 2 Mbps data rate
  - Long range (Coded PHY)
  - Advertising extensions
  - Channel selection algorithm #2
  - GATT caching
  - Direction finding (AoA/AoD)
  - LE Ping procedure
  - Periodic advertising and periodic advertising sync transfer
  - LE L2CAP connection-oriented channel
  - LE power control and path loss monitoring
- Radio
  - RX sensitivity level: -97 dBm @ 1 Mbps, -104 dBm @ 125 kbps (long range)
  - Programmable output power up to +8 dBm (at antenna connector)
  - Data rate supported: 2 Mbps, 1 Mbps, 500 kbps and 125 kbps
  - 128 physical connections
  - Integrated balun
  - Support for external PA and LNA
  - BlueNRG core coprocessor (DMA based) for Bluetooth Low Energy timing critical operation
  - 2.4 GHz proprietary radio driver
  - Suitable for systems requiring compliance with the following radio frequency regulations: ETSI EN 300 328, EN 300 440, FCC CFR47 part 15, ARIB STD-T66
- Ultra-low power radio performance
  - 8 nA in SHUTDOWN mode (1.8 V)
  - 0.8 uA in DEEPSTOP mode (with external LSE and BLE wake-up sources, 1.8 V)
  - 1.0 uA in DEEPSTOP mode (with internal LSI and BLE wake-up sources, 1.8 V)
  - 4.3 mA peak current in TX (@ 0 dBm, 3.3 V)
  - 3.4 mA peak current in RX (@ sensitivity level, 3.3V)
- High performance and ultra-low power Arm® Cortex®-M0+ 32-bit, running up to 64 MHz
- Dynamic current consumption: 14 µA/MHz
- Operating supply voltage: from 1.7 to 3.6 V
- -40 °C to 105 °C temperature range
- Supply and reset management
  - High efficiency embedded SMPS step-down converter with intelligent bypass mode
  - Ultra-low power power-on-reset (POR) and power-down-reset (PDR)
  - Programmable voltage detector (PVD)

- Clock sources
  - 64 MHz PLL
  - Fail safe 32 MHz crystal oscillator with integrated trimming capacitors
  - 32 kHz crystal oscillator
  - Internal low-power 32 kHz RO
- On-chip non-volatile Flash memory of 192 kB
- On-chip RAM of 24 kB + 4 kB PKA RAM
- One-time-programmable (OTP) memory area of 1 kB
- Embedded UART bootloader
- Ultra-low power modes with or without timer and RAM retention
- Quadrature decoder
- Enhanced security mechanisms such as:
  - Flash read/write protection
  - SWD disabling
  - Secure bootloader
- Security features
  - True random number generator (RNG)
  - Hardware encryption AES maximum 128-bit security co-processor
  - HW public key accelerator (PKA)
  - Cryptographic algorithms: RSA, Diffie-Helman, ECC over GF(p)
  - CRC calculation unit
  - 64-bit unique ID
- System peripherals
  - 1x DMA controller with 8 channels supporting ADC, SPI-I2S, I2C, USART, LPUART, TIMERS
  - 1x SPI with I2S interface multiplexed
  - 1x I<sup>2</sup>C (SMBus/PMBus)
  - 1x LPUART (low power)
  - 1x USART (ISO 7816 smartcard mode, IrDA, SPI Master and Modbus)
  - 1x independent WDG
  - 1x real-time clock (RTC)
  - 1x independent SysTick
  - 1x 16-bits, four channel general purpose timer
  - 2x 16-bits, two channel general purpose timer
  - Infrared interface
- Up to 20 fast I/Os
  - All of them with wake-up capability
  - All of them retain state in low-power
  - All of them 5 V tolerant
- Analog peripherals
  - 12-bit ADC with 8 input channels, up to 16 bits with down sampler
  - Battery monitoring
  - Analog watchdog
- Development support
  - Serial wire debug (SWD)
  - 4 breakpoints and 2 watchpoints
- All packages are ECOPACK2 compliant

## Applications

- Industrial
- Home and industrial automation
- Asset tracking, ID location, real-time locating system
- Smart lighting
- Fitness, wellness and sports
- Healthcare, consumer medical
- Security/proximity
- Remote control
- Assisted living
- Mobile phone peripherals
- PC peripherals

## Description

The BlueNRG-LPS is an ultra-low power programmable Bluetooth® Low Energy wireless SoC solution. It embeds STMicroelectronics's state-of-the-art 2.4 GHz radio IPs, optimized for ultra-low-power consumption and excellent radio performance, for unparalleled battery lifetime. It is compliant with Bluetooth® Low Energy SIG core specification version 5.3 addressing point-to-point connectivity and Bluetooth Mesh networking and allows large-scale device networks to be established in a reliable way. The BlueNRG-LPS is also suitable for 2.4 GHz proprietary radio wireless communication to address ultra-low latency applications.

The BlueNRG-LPS embeds a Arm® Cortex®-M0+ microcontroller that can operate up to 64 MHz and also the BlueNRG core co-processor (DMA based) for Bluetooth Low Energy timing critical operations.

The main Bluetooth® Low Energy 5.3 specification supported features are:

2 Mbps data rate, long range (Coded PHY), advertising extensions, channel selection algorithm #2, GATT caching, Direction Finding (AoA/AoD), hardware support for simultaneous connection, master/slave and multiple roles simultaneously, extended packet length support, LE Ping procedure, periodic advertising and periodic advertising sync transfer, LE power control and path loss monitoring.

In addition, the BlueNRG-LPS provides enhanced security hardware support by dedicated hardware functions:

True random number generator (RNG), encryption AES maximum 128-bit security co-processor, public key accelerator (PKA), CRC calculation unit, 64-bit unique ID, Flash memory read and write protection.

The Public Key Acceleration (PKA) supports the modular arithmetic including exponentiation with maximum modulo size of 3136 bits and the elliptic curves over prime field scalar multiplication, ECDSA signature, ECDSA verification with maximum modulo size of 521 bits CRC calculation unit.

The BlueNRG-LPS can be configured to support standalone or network processor applications. In the first configuration, the BlueNRG-LPS operates as a single device in the application for managing both the application code and the Bluetooth Low Energy stack.

The BlueNRG-LPS embeds high-speed and flexible memory types:

Flash memory of 192 kB, RAM memory of 24 kB, one-time-programmable (OTP) memory area of 1 kB, ROM memory of 7 kB.

Direct data transfer between memory and peripherals and from memory-to-memory is supported by eight DMA channels with a full flexible channel mapping by the DMAMUX peripheral.

The BlueNRG-LPS embeds a 12-bit ADC, allowing measurements of up to eight external sources and up to three internal sources, including battery monitoring and a temperature sensor.

The BlueNRG-LPS has a low-power RTC and three general purpose 16-bit timers.

The BlueNRG-LPS features standard and advanced communication interfaces:

1x SPI/I2S, 1x LPUART, 1x USART supporting ISO 7816 (smartcard mode), IrDA and Modbus mode, 1x I<sup>2</sup>C supporting SMBus/PMBus.

The BlueNRG-LPS operates in the -40 to +105 °C temperature range from a 1.7 V to 3.6 V power supply. A comprehensive set of power-saving modes enables the design of low-power applications.

The BlueNRG-LPS integrates a high efficiency SMPS step-down converter and an integrated PDR circuitry with a fixed threshold that generates a device reset when the VDD drops under 1.65 V.

The BlueNRG-LPS comes in different package versions supporting up to:

20 I/Os for the QFN32 package. 20 I/Os for the WLCSP36 package.

**Figure 1. The BlueNRG-LPS block diagram**

# 1 Functional overview

## 1.1 System architecture

The main system consists of 32-bit multilayer AHB bus matrix that interconnects:

- Three masters:
  - CPU (Cortex®-M0+) core S-bus
  - DMA1
  - Radio system
- Seven slaves:
  - Internal Flash memory on CPU (Cortex®-M0+) S bus
  - Internal SRAM0 (12 kB)
  - Internal SRAM1 (12 kB)
  - APB0 peripherals (through an AHB to APB bridge)
  - APB1 peripherals (through an AHB to APB bridge)
  - AHB0 peripherals
  - AHBRF including AHB to APB bridge and radio peripherals (connected to APB2)

The bus matrix provides access from a master to a slave, enabling concurrent access and efficient operation even when several high-speed peripherals work simultaneously.

**Figure 2. Bus matrix**

## 1.2 Arm® Cortex®-M0+ core with MPU

The BlueNRG-LPS contains an Arm® Cortex®-M0+ microcontroller core. The Arm® Cortex®-M0+ was developed to provide a low-cost platform that meets the needs of CPU implementation, with a reduced pin count and low-power consumption, while delivering outstanding computational performance and an advanced response to interrupts. The Arm® Cortex®-M0+ can run from 1 MHz up to 64 MHz.

The Arm® Cortex®-M0+ processor is built on a highly area and power optimized 32-bit processor core, with a 2-stage pipeline Von Neumann architecture. The processor delivers exceptional energy efficiency through a small but powerful instruction set and extensively optimized design, providing high-end processing hardware including a single-cycle multiplier.

The interrupts are handled by the Arm® Cortex®-M0+ Nested Vector Interrupt Controller (NVIC). The NVIC controls specific Arm® Cortex®-M0+ interrupts as well as the BlueNRG-LPS peripheral interrupts. With its embedded ARM core, the BlueNRG-LPS family is compatible with all ARM tools and software.

## 1.3 Memories

### 1.3.1 Embedded Flash memory

The Flash controller implements the erase and program Flash memory operation. The flash controller also implements the read and write protection.

The Flash memory features are:

- Memory organization:
  - 1 bank of 192 kB
  - Page size: 2 kB
  - Page number 96
- 32-bit wide data read/write
- Page erase and mass erase

The Flash controller features are:

- Flash memory read operations: single read or mass read
- Flash memory write operations: single data write or 4x32-bits burst write or mass write
- Flash memory erase operations: page erase or mass erase
- Page write protect mechanism: 4 variable-size memory segments

### 1.3.2 Embedded SRAM

The BlueNRG-LPS has a total of 24 kB of embedded SRAM, split into two banks as shown in the following table:

**Table 1. SRAM overview**

| SRAM bank | Size  | Address     | Retained in DEEPSTOP     |
|-----------|-------|-------------|--------------------------|
| SRAM0     | 12 kB | 0x2000 0000 | Always                   |
| SRAM1     | 12 kB | 0x2000 3000 | Programmable by the user |

### 1.3.3 Embedded ROM

The BlueNRG-LPS has a total of 7 kB of embedded ROM. This area is ST reserved and contains:

- The UART bootloader from which the CPU boots after each reset (first 6 kB of ROM memory)
- Some ST reserved values including the ADC trimming values (the last 1 kB of ROM memory)

### 1.3.4 Embedded OTP

The one-time-programmable (OTP) is a memory of 1 kB dedicated for user data. The OTP data cannot be erased.

The user can protect the OTP data area by writing the last word at address 0x1000 1BFC and by performing a system reset. This operation freezes the OTP memory from further unwanted write operations.

### 1.3.5 Memory protection unit (MPU)

The MPU is used to manage accesses to memory to prevent one task from accidentally corrupting the memory or resources used by any other active task. This memory area is organized into up to 8 protected areas. The protection area sizes are between 32 bytes and the whole 4 gigabytes of addressable memory.

The MPU is especially helpful for applications where some critical or certified code has to be protected against the misbehavior of other tasks. It is usually managed by an RTOS (real-time operating system). If a program accesses a memory location that is prohibited by the MPU, the RTOS can detect it and take action. In an RTOS environment, the kernel can dynamically update the MPU area settings, based on the process to be executed.

The MPU is optional and can be bypassed for applications that do not need it.

## 1.4 Security and safety

The BlueNRG-LPS contains many security blocks for the BLE and the host application.

It includes:

- Flash read/write protection over accidental and intentional actions
- As protection against potential hacker attacks, the SWD access can be disabled
- Secure bootloader (refer to the dedicated application note AN5471)
- Customer storage of the BLE keys
- True random number generator (RNG)
- Public key accelerator (PKA) including:
  - Modular arithmetic including exponentiation with maximum modulo size of 3136 bits
  - Elliptic curves over prime field scalar multiplication, ECDSA signature, ECDSA verification with maximum modulo size of 521 bits
- Cyclic redundancy check calculation unit (CRC)

## 1.5 RF subsystem

The BlueNRG-LPS embeds an ultra-low power radio, compliant with Bluetooth® Low Energy (BLE) specification. The BLE features 1 Mbps and 2 Mbps transfer rates as well as long range options (125 kbps, 500 kbps), supports multiple roles simultaneously acting at the same time as Bluetooth® Low Energy sensor and hub device.

The BLE protocol stack is implemented by an efficient system partitioned as follows:

- Hardware part: BlueCore handling time critical and time consuming BLE protocol parts
- Firmware part: Arm® Cortex®-M0+ core handling non time critical BLE protocol parts

### 1.5.1 RF front-end block diagram

The RF front end is based on a direct modulation of the carrier in TX, and uses a low IF architecture in RX mode.

Thanks to an internal transformer with RF pins, the circuit directly interfaces the antenna (single ended connection, impedance close to 50  $\Omega$ ). The natural band pass behavior of the internal transformer simplifies outside circuitry aimed at harmonic filtering and out of band interferer rejection.

In transmit mode, the maximum output power is user selectable through the programmable LDO voltage of the power amplifier. A linearized, smoothed analog control offers a clean power ramp-up.

In receive mode the circuit can be used in standard high performance or in reduced power consumption (user programmable). The automatic gain control (AGC) is able to reduce the chain gain at both RF and IF locations, for an optimized interferer rejection. Thanks to the use of complex filtering and highly accurate I/Q architecture, high sensitivity, and excellent linearity can be achieved.

**Figure 3. BlueNRG-LPS RF block diagram**

**Note:** QFN32: VSS through exposed pad, and VSSRF pins must be connected to ground plane.  
CSP36: VSSRF pins must be connected to ground plane.

## 1.6 Power supply management

### 1.6.1 SMPS step-down regulator

The device integrates a step-down converter to improve low power performance when the VDD voltage is high enough. The SMPS output voltage can be programmed from 1.2 V to 1.90 V. It is internally clocked at 4 MHz or 8 MHz.

The device can be operated without the SMPS by just wiring its output to VDD. This is the case for applications where the voltage is low, or where the power consumption is not critical.

Except for the configuration SMPS OFF, an L/C BOM must be present on the board and connected to the VFBS pad.

Figure 4. Power supply configuration

## 1.6.2

### Power supply schemes

The BlueNRG-LPS embeds three power domains:

- VDD33 (VDDIO or VDD):
  - the voltage range is between 1.7 V and 3.6 V
  - it supplies a part of the I/O ring, the embedded regulators and the system analog IPs as power management block and embedded oscillators
- VDD12o:
  - always-on digital power domain
  - this domain is generally supplied at 1.2 V during active phase of the device
  - this domain is supplied at 1.0 V during low power mode (DEEPSTOP)
- VDD12i:
  - interruptible digital power domain
  - this domain is generally supplied at 1.2 V during active phase of the device
  - this domain is shut down during low power mode (DEEPSTOP)

Figure 5. Power supply domain overview

## 1.6.3

### Linear voltage regulators

The digital power supplies are provided by different regulators:

- The main LDO (MLDO):
  - it provides 1.2 V from a 1.4-3.3 V input voltage
  - it supplies both VDD12i and VDD12o when the device is active
  - it is disabled during the low power mode (DEEPSTOP)
- Low power LDO (LPREG):
  - it stays enabled during both active and low power phases
  - it provides 1.0 V voltage
  - it is not connected to the digital domain when the device is active
  - it is connected to the VDD12o domain during low power mode (DEEPSTOP)
- A dedicated LDO (RFLDO) to provide a 1.2 V to the analog RF block

An embedded SMPS step-down converter is available (inserted between the external power and the LDOs).

#### 1.6.4 Power supply supervisor

The BlueNRG-LPS device embeds several power voltage monitoring:

- Power-on-reset (POR): during the power-on, the device remains in reset mode if VDDIO is below a VPOR threshold (typically 1.65 V)
- Power-down-reset (PDR): during power-down, the PDR puts the device under reset when the supply voltage (VDD) drops below the VPDR threshold (around 20 mV below VPOR). The PDR feature is always enabled
- Power voltage detector (PVD): can be used to monitor the VDDIO (against a programmed threshold) or an external analog input signal. When the feature is enabled and the PVD measures a voltage below the comparator, an interrupt is generated (if unmasked)

### 1.7 Operating modes

Several operating modes are defined for the BlueNRG-LPS:

- RUN mode
- DEEPSTOP mode
- SHUTDOWN mode

**Table 2. Relationship between the low power modes and functional blocks**

| Mode                          | SHUTDOWN                    | DEEPSTOP                 | IDLE               | RUN                |
|-------------------------------|-----------------------------|--------------------------|--------------------|--------------------|
| CPU                           | OFF                         | OFF                      | OFF                | ON                 |
| Flash                         | OFF                         | OFF                      | ON                 | ON                 |
| RAM                           | OFF                         | ON/OFF granularity 12 kB | ON/OFF             | ON/OFF             |
| Radio                         | OFF                         | OFF                      | ON/OFF             | ON/OFF             |
| Supply system                 | OFF                         | OFF                      | ON ( DC-DC ON/OFF) | ON ( DC-DC ON/OFF) |
| Register retention            | OFF                         | ON                       | ON                 | ON                 |
| HS clock                      | OFF                         | OFF                      | ON                 | ON                 |
| LS clock                      | OFF                         | ON/OFF                   | ON                 | ON                 |
| Peripherals                   | OFF                         | OFF                      | ON/OFF             | ON/OFF             |
| Wake-on RTC                   | OFF                         | ON/OFF                   | ON/OFF             | NA                 |
| Wake on LPUART                | OFF                         | ON/OFF                   | ON/OFF             | NA                 |
| Wake on IWDG                  | OFF                         | ON/OFF                   | ON/OFF             | NA                 |
| Wake-on GPIOs                 | OFF                         | ON/OFF                   | ON/OFF             | NA                 |
| Wake-on reset pin             | ON                          | ON                       | ON                 | NA                 |
| GPIOs configuration retention | PWRC pull-up/pull-down only | ON                       | ON                 | ON                 |

### 1.7.1 RUN mode

In RUN mode the BlueNRG-LPS is fully operational:

- All interfaces are active
- The internal power supplies are active
- The system clock and the bus clock are running
- The CPU core and the radio can be used

The power consumption may be reduced by gating the clock of the unused peripherals.

### 1.7.2 DEEPSTOP mode

DEEPSTOP is the only low-power mode of the BlueNRG-LPS allowing the restart from a saved context environment and the application at wake-up to go on running.

The conditions to enter DEEPSTOP mode are:

- The radio is sleeping (no radio activity)
- The CPU is sleeping (WFI with SLEEPDEEP bit activated)
- No unmasked wake-up sources are active
- The low-power mode selection (LPMS) bit of the power controller unit is 0 (default)
- The GPIO Retention Mode Selection (GPIORET) bit of the Power Controller unit must be set

In DEEPSTOP mode:

- The system and the bus clocks are stopped
- Only the essential digital power domain is ON and supplied at 1.0 V
- The bank RAM0 is kept in retention
- The bank RAM1 can be in retention or not, depending on the software configuration
- The I/Os pull-up and pull-down can be controlled during DEEPSTOP mode, depending on the software configuration
- The low speed clock can be running or stopped, depending on the software configuration:
  - ON or OFF
  - Sourced by LSE or by LSI
- The RTC, IWDG and LPUART stay active, if enabled and the low speed clock is ON
- The radio wake-up block, including its timer, stay active (if enabled and the low speed clock is ON)
- Up to 20 GPIOs retaining their configuration:
  - I/Os retain the RUN mode configuration while in DEEPSTOP mode
- Up to 20 I/Os are able to be in output driving:
  - A static low or high level
- Some I/Os are able to be in output driving:
  - The low speed clock (on PA10)
  - The RTC output (on PA8)

Possible wake-up sources are:

- The radio block is able to generate two events to wake up the system through its embedded wake-up timer running on low speed clock:
  - Radio wake-up time is reached
  - CPU host wake-up time is reached
- The RTC can generate a wake-up event
- The IWDG can generate a reset event
- The LPUART is able to generate a wake-up event
- All GPIOs are able to wake up the system

At wake-up, all the hardware resources located in the digital power domain that are OFF during the DEEPSTOP mode, are reset. The CPU reboots. The wake-up reason is visible in the register of the power controller.

### 1.7.3 SHUTDOWN mode

The SHUTDOWN mode is the least power consuming mode.

The conditions to enter SHUTDOWN mode are the same conditions needed to enter DEEPSLEEP mode except that the LPMS bit of the power controller unit is 1.

In SHUTDOWN mode, the BlueNRG-LPS is in ultra-low power consumption: all voltage regulators, clocks and the RF interface are not powered. The BlueNRG-LPS can enter shutdown mode by internal software sequence. The only way to exit shutdown mode is by asserting and deasserting the RSTN pin.

In SHUTDOWN mode:

- The system is powered down as both the regulators are OFF
- The VDDIO power domain is ON
- All the clocks are OFF, LSI and LSE are OFF
- The I/Os pull-up and pull-down can be controlled during SHUTDOWN mode, depending on the software configuration
- The only wake-up source is a low pulse on the RSTN pin

The exit from SHUTDOWN is similar to a POR startup. The PDR feature can be enabled or disabled during SHUTDOWN.

## 1.8 Reset management

The BlueNRG-LPS offers two different resets:

- The PORESETn: this reset is provided by the low power management unit (LPMU) analog block and corresponds to a POR or PDR root cause. It is linked to power voltage ramp-up or ramp-down. This reset impacts all resources of the BlueNRG-LPS. The exit from SHUTDOWN mode is equivalent to a POR and thus generates a PORESETn. The PORESETn signal is active when the power supply of the device is below a threshold value or when the regulator does not provide the target voltage.
- The PADRESETn (system reset): this reset is built through several sources:
  - PORESETn
  - Reset due to the watchdog  
The BlueNRG-LPS device embeds a watchdog timer, which may be used to recover from software crashes
  - Reset due to CPU Lockup  
The Cortex®-M0+ generates a lockup to indicate the core is in the lock-up state resulting from an unrecoverable exception. The lock-up reset is masked if a debugger is connected to the Cortex®-M0+
  - Software system reset  
The system reset request is generated by the debug circuitry of the Cortex®-M0+. The debugger sets the SYSRESETREQ bit of the application interrupt and reset control register (AIRCR). This system reset request through the AIRCR can also be done by the embedded software (into the hardfault handler for instance)
  - Reset from the RSTN external pin  
The RSTN pin toggles to inform that a reset has occurred

This PADRESETn resets all resources of the BlueNRG-LPS, except:

- Debug features
- Flash controller key management
- RTC timer
- Power controller unit
- Part of the RCC registers

The pulse generator guarantees a minimum reset pulse duration of 20  $\mu$ s for each internal reset source. In case of reset from the RSTN external pad, the reset pulse is generated when the pad is asserted low.

## 1.9 Clock management

Three different clock sources may be used to drive the system clock of the BlueNRG-LPS:

- HSI: high speed internal 64 MHz RC oscillator
- PLL64M: 64 MHz PLL clock
- HSE: high speed 32 MHz external crystal

The BlueNRG-LPS also has a low speed clock tree used by some timers in the radio, RTC, IWDG and LPUART.

Three different clock sources can be used for this low speed clock tree:

- Low speed internal (LSI): low speed and low drift internal RC with a fixed frequency between 24 kHz and 49 kHz depending on the sample
- Low speed external (LSE) from:
  - An external crystal 32.768 kHz
  - A single-ended 32.738 kHz input signal
- A 32 kHz clock derived from dividing HSI or HSE. In this case, the slow clock is not available in DEEPSTOP low-power mode

By default, after a system reset, all low speed sources are OFF.

Both the activation and the selection of the slow clock are relevant during DEEPSTOP mode and at wakeup as slow clock generates a clock for the timers involved in wake-up event generation.

The HSI and the PLL64M clocks are provided by the same analog block called RC64MPLL. The 64 MHz clock output by this block can be:

- A non-accurate clock when no external XO provides an input clock to this block (HSI)
- An accurate clock when the external XO provides the 32 MHz and once its internal PLL is locked (PLL64M)

After reset, the CLK\_SYS is divided by four to provide 16 MHz to the whole system (CPU, DMA, memories and peripherals).

Figure 6. Clock tree

It is possible to output some internal clocks on external pads:

- The low speed clocks can be output on the LCO I/O
- The high speed clocks can be output on the MCO I/O

This is possible by programming the associated I/O in the correct alternate function.

Most of the peripherals only use the system clock except:

- I<sup>2</sup>C, USART: they use an always 16 MHz clock to have a fixed reference clock for baud rate management. The goal is to allow the CPU to boost or slow down the system clock (depending on on-going activities) without impacting a potential on-going serial interface transfer on external I/Os

- LPUART: always uses a 16 MHz clock or LSE to have a fixed reference clock for baud rate management. The goal is to allow the CPU to boost or slow down the system clock (depending on on-going activities) without impacting a potential on-going serial interface transfer on external I/Os.
- SPI: when using the I2S mode, the baud rate is managed through the always 16 MHz or always 32 MHz clock or system clock (CLK\_SYS) to reach higher baud rates. When running in other modes than the I2S, the baud rate is managed by the system clock. This implies its baud rate is impacted by dynamic system clock frequency changes.
- RNG: in parallel with the system clock, the RNG uses an always 16 MHz clock to generate at a constant frequency the random number whatever the system clock frequency
- Flash controller: in parallel with the system clock, the Flash controller uses an always 16 MHz clock to generate specific delays required by the Flash memory during programming and erase operations for example
- PKA: in parallel with the system clock, the PKA uses the system clock frequency
- Radio: it does not directly use the system clock for its APB/AHB interfaces, but the system clock with a potential divider (1 or 2 or 4). In parallel, the radio uses an always 16 MHz and an always 32 MHz for modulator, demodulator and to have a fixed reference clock to manage specific delays
- ADC: in parallel with the system clock, ADC uses a 64 MHz prescaled clock running at 16 MHz

## 1.10 Boot mode

Following CPU boot, the application software can modify the memory map at address 0x0000 0000. This modification is performed by programming the REMAP bit in the Flash controller.

The following memory can be remapped:

- Main Flash memory
- SRAM0 memory

## 1.11 Embedded UART bootloader

The BlueNRG-LPS has a pre-programmed bootloader supporting UART protocol with automatic baud rate detection. The main features of the embedded bootloader are:

- Auto baud rate detection up to 1 Mbps
- Flash mass erase, section erase
- Flash programming
- Flash readout protection enable/disable

The pre-programmed bootloader is an application, which is stored in the BlueNRG-LPS internal ROM at manufacturing time by STMicroelectronics. This application allows upgrading the device Flash with a user application using a serial communication channel (UART).

Bootloader is activated by hardware by forcing PA10 high during hardware reset, otherwise, application residing in Flash is launched.

*Note: Bootloader protocol is described in a separate application note (the UART bootloader protocol, AN5471)*

## 1.12 General purpose inputs/outputs (GPIO)

Each of the GPIO pins can be configured by software as output (push-pull or open-drain), as input (with or without pull-up or pull-down) or as peripheral alternate function. Most of the GPIO pins are shared with digital or analog alternate functions. Fast I/O toggling can be achieved thanks to their mapping on the AHB0 bus.

The I/Os alternate function configuration can be locked if needed following a specific sequence in order to avoid spurious writing to the I/Os registers.

## 1.13 Direct memory access (DMA)

The DMA is used in order to provide high-speed data transfer between peripherals and memory as well as memory-to-memory. Data can be quickly moved by DMA without any CPU actions. In this manner, CPU resources are free for other operations.

The DMA controller has eight channels in total. Each has an arbiter to handle the priority among DMA requests.

DMA main features are:

- Eight independently configurable channels (requests)

- Each of the eight channels is connected to dedicated hardware DMA requests, software trigger is also supported on each channel. This configuration is done by software
- Priorities among requests from channels of DMA are software programmable (four levels consisting of very high, high, medium, low) or hardware in case of equality (request 1 has priority over request 2, and so on)
- Independent source and destination transfer size (byte, half word, word), emulating packing and unpacking. Source/destination addresses must be aligned on the data size
- Support for circular buffer management
- Three event flags (DMA half transfer, DMA transfer complete and DMA transfer error) logically ORed together in a single interrupt request for each channel
- Memory-to-memory transfer (RAM only)
- Peripheral-to-memory and memory-to-peripheral, and peripheral-to-peripheral transfers
- Access to SRAMs, APB0 and APB1 peripherals as source and destination
- Programmable number of data to be transferred: up to 65536

## 1.14 Nested vectored interrupt controller (NVIC)

The interrupts are handled by the Cortex®-M0+ nested vector interrupt controller (NVIC). NVIC controls specific Cortex®-M0+ interrupts as well as the BlueNRG-LPS peripheral interrupts.

The NVIC benefits are the following:

- Nested vectored interrupt controller that is an integral part of the ARM® Cortex®-M0+
- Tightly coupled interrupt controller provides low interrupt latency
- Control system exceptions and peripheral interrupts
- NVIC supports 32 vectored interrupts
- Four programmable interrupt priority levels with hardware priority level masking
- Software interrupt generation using the ARM® exceptions SVCALL and PENDSV
- Support for NMI
- ARM® Cortex® M0+ vector table offset register VTOR implemented

NVIC hardware block provides flexible interrupt management features with minimal interrupt latency.

## 1.15 Analog digital converter (ADC)

The BlueNRG-LPS embeds a 12-bit ADC. The ADC consists of a 12-bit successive approximation analog-to-digital converter (SAR) with 2 x 8 multiplexed channels allowing measurements of up to eight external sources and up to two internal sources.

The ADC main features are:

- Conversion frequency is up to 1 Msps
- Three input voltage ranges are supported (0 - 1.2 V, 0 - 2.4 V, 0 - 3.6 V)
- Up to eight analog single-ended channels or four analog differential inputs or a mix of both
- Temperature sensor conversion
- Battery level conversion up to 3.6 V
- ADC continuous or single mode conversion is possible
- ADC down-sampler for multi-purpose applications to improve analog performance while off-loading the CPU (ratio adjustable from 1 to 128)
- A watchdog feature to inform when data is outside thresholds
- DMA capability
- Interrupt sources with flags.

### 1.15.1 Temperature sensor

The temperature sensor (TS) generates a voltage that varies linearly with temperature. The temperature sensor is internally connected to the ADC input channel, which is used to convert the sensor output voltage into a digital value.

To improve the accuracy of the temperature sensor measurement, each device is individually factory-calibrated by ST. The temperature sensor factory calibration data are stored by ST in the system memory area, accessible in read-only mode.

## 1.16 True random number generator (RNG)

RNG is a random number generator based on a continuous analog noise that provides a 16-bit value to the host when read. The minimum period is 1.25  $\mu$ s, corresponding to 20 RNG clock cycles between two consecutive random number.

## 1.17 Timers and watchdog

The BlueNRG-LPS includes three general-purpose timers, one watchdog timer and a SysTick timer.

### 1.17.1 General-purpose timers (TIM2, TIM16, TIM17)

There are up to three general-purpose timers embedded in the BlueNRG-LPS.

Each general-purpose timer can be used to generate PWM outputs, or act as a simple time base.

- TIM2
  - Full-featured general-purpose timer
  - Features four independent channels for input capture/output compare, PWM or one-pulse mode output
  - Independent DMA request generation, support of quadrature encoders
- TIM16 and TIM17
  - General-purpose timers with mid-range features:
  - 16-bit auto-reload upcounters and 16-bit prescalers
  - 1 channel and 1 complementary channel
  - All channels can be used for input capture/output compare, PWM or one-pulse mode output
  - The timers have independent DMA request generation
  - The timers are internally connected to generate an infrared interface (IRTIM) for remote control

### 1.17.2 Independent watchdog (IWDG)

The independent watchdog is based on a 12-bit downcounter and 8-bit prescaler. It is clocked from the LS clock and it can operate in DEEPSLEEP mode. It can also be used as a watchdog to reset the device when a problem occurs.

### 1.17.3 SysTick timer

This timer is dedicated to real-time operating systems, but could also be used as a standard down counter. It features:

- A 24-bit down counter
- Autoreload capability
- Maskable system interrupt generation when the counter reaches 0

## 1.18 Real-time clock (RTC)

The RTC is an independent BCD timer/counter. The RTC provides a time of day/clock/calendar with programmable alarm interrupt. RTC includes also a periodic programmable wake-up flag with interrupt capability. The RTC provides an automatic wake-up to manage all low power modes.

Two 32-bit registers contain seconds, minutes, hours (12- or 24-hour format), day (day of week), date (day of month), month, and year, expressed in binary coded decimal format (BCD). The sub-second value is also available in binary format. Compensations for 28-, 29- (leap year), 30-, and 31-day months are performed automatically. Daylight saving time compensation can also be performed. Additional 32-bit registers contain the programmable alarm sub seconds, seconds, minutes, hours, day, and date.

A digital calibration circuit with 0.95 ppm resolution is available to compensate for quartz crystal inaccuracy. After power-on reset, all RTC registers are protected against possible parasitic write accesses. As long as the supply voltage remains in the operating range, the RTC never stops, regardless of the device status (RUN mode, low power mode or under system reset). The RTC counter does not freeze when CPU is halted by a debugger.

## 1.19 Inter-integrated circuit interface (I<sup>2</sup>C)

The BlueNRG-LPS embeds one I<sup>2</sup>Cs. The I<sup>2</sup>C bus interface handles communications between the microcontroller and the serial I<sup>2</sup>C bus. It controls all I<sup>2</sup>C bus-specific sequencing, protocol, arbitration and timing.

The I<sup>2</sup>C peripheral supports:

- I<sup>2</sup>C bus specification and user manual rev. 5 compatibilities:
  - Slave and master modes
  - Multimaster capability
  - Standard-mode (Sm), with a bitrate up to 100 kbit/s
  - Fast-mode (Fm), with a bitrate up to 400 kbit/s
  - Fast-mode Plus (fm+), with a bitrate up to 1 Mbit/s and 20 mA output driver I/Os
  - 7-bit and 10-bit addressing mode
  - Multiple 7-bit slave addresses (2 addresses, 1 with configurable mask)
  - All 7-bit address acknowledge mode
  - General call
  - Programmable setup and hold times
  - Easy to use event management
  - Optional clock stretching
  - Software reset
- System management Bus (SMBus) specification rev 2.0 compatibility:
  - Hardware PEC (Packet Error Checking) generation and verification with ACK control
  - Address resolution protocol (ARP) support
  - Host and device support
  - SMBus alert
  - Timeouts and idle condition detection
- Power system management protocol (PMBus<sup>TM</sup>) specification rev 1.1 compatibility
- Independent clock: a choice of independent clock sources allowing the I<sup>2</sup>C communication speed to be independent from the PCLK reprogramming
- Programmable analog and digital noise filters
- 1-byte buffer with DMA capability

## 1.20 Universal synchronous/asynchronous receiver transmitter (USART)

USART offers flexible full-duplex data exchange with external equipment requiring an industry standard NRZ asynchronous serial data format. USART is able to communicate with a speed up to 2 Mbit/s. Furthermore, USART is able to detect and automatically set its own baud rate, based on the reception of a single character.

The USART peripheral supports:

- Synchronous one-way communication
- Half-duplex single wire communication
- Local interconnection network (LIN) master/slave capability
- Smart card mode, ISO 7816 compliant protocol
- IrDA (infrared data association) SIR ENDEC specifications
- Modem operations (CTS/RTS)
- RS485 driver enable
- Multiprocessor communications
- SPI-like communication capability

High speed data communication is possible by using DMA (direct memory access) for multibuffer configuration.

## 1.21 LPUART

The device embeds one low-power UART, enabling asynchronous serial communication with minimum power consumption. The LPUART supports half duplex single wire communication and modem operations (CTS/RTS), allowing multiprocessor communication.

The LPUART has a clock domain independent from the CPU clock, and can wake up the system from DEEPSLEEP mode using baud rates up to 9600 baud. The wake-up events from Stop mode are programmable and can be:

- Start bit detection
- Any received data frame
- A specific programmed data frame

Only a 32.768 kHz clock (LSE) is needed to allow LPUART communication up to 9600 baud. Therefore, even in DEEPSTOP mode, the LPUART can wait for an incoming frame while having an extremely low energy consumption. Higher speed clock can be used to reach higher baud rates in RUN mode.

The LPUART interfaces can be served by the DMA controller.

## 1.22 Serial peripheral interface (SPI)

The BlueNRG-LPS has one SPI interface (SPI3) allowing communication up to 32 Mbit/s in both master and slave modes. The SPI peripheral supports:

- Master or slave operation
- Multimaster support
- Full-duplex synchronous transfers on three lines
- Half-duplex synchronous transfer on two lines (with bidirectional data line)
- Simplex synchronous transfers on two lines (with unidirectional data line)
- Serial communication with external devices
- NSS management by hardware or software for both master and slave: dynamic change of master/slave operations
- SPI Motorola support
- SPI TI mode support
- Hardware CRC feature for reliable communication

All SPI interfaces can be served by the DMA controller.

## 1.23 Inter-IC sound (I2S)

The BlueNRG-LPS SPI interface SPI3 supports the I2S protocol. The I2S interface can operate in slave or master mode with half-duplex communication. It can address four different audio standards:

- Philips I2S standard
- MSB-justified standards (left-justified)
- LSB-justified standards (right-justified)
- PCM standard.

The I2S interfaces DMA capability for transmission and reception.

## 1.24 Serial wire debug port

The BlueNRG-LPS embeds an ARM SWD interface that allows interactive debugging and programming of the device. The interface is composed of only two pins: SWDIO and SWCLK. The enhanced debugging features for developers allow up to 4 breakpoints and up to 2 watchpoints.

## 1.25 TX and RX event alert

The BlueNRG-LPS is provided with the TX\_SEQUENCE and RX\_SEQUENCE signals which alert, respectively, transmission and reception activities.

A signal can be enabled for TX and RX on two pins, through alternate functions:

- TX\_SEQUENCE is available on PA10 (AF2) or PB14 (AF1).
- RX\_SEQUENCE is available on PA8 (AF2) or PA11 (AF2).

The signal is high when radio is in TX (or RX), low otherwise.

The signals can be used to control external antenna switching and support coexistence with other wireless technologies.

*Note:*

*The RF\_ACTIVITY signal is used to notify if there is an ongoing RF operation ( either TX or RX). It is a logical OR between the RX\_SEQUENCE and TX\_SEQUENCE. This signal can be used to enable an antenna switch component when achieving antenna switching during AoA or AoD operation.*

## 1.26 Direction finding

The BlueNRG-LPS Bluetooth radio controller supports the angle of arrival (AoA) and angle of departure (AoD) features by managing:

- the constant tone extension (CTE) inside a packet
- the antenna switching mechanism for both AoA and AoD.

The antenna switching mechanism provides a 7-bit antenna identifier `ANTENNA_ID[6:0]` indicating the antenna number to be used.

In a AoD transmitter or in a AoA receiver, the radio needs to switch antenna during the CTE field of the packet. For this purpose, the `ANTENNA_ID` signal can be enabled on some I/Os, by programming them in the associated alternate function. This signal needs to be provided to an external antenna switching circuit, since `ANTENNA_ID[0]` is the least significant bit and `ANTENNA_ID[6]` the most significant bit of the antenna identifier to be used.

## 2 Pinouts and pin description

The BlueNRG-LPS comes in two package versions: WLCSP36 offering 20 GPIOs and QFN32 offering 20 GPIOs.

**Figure 7. Pinout top view (QFN32 package)**

Figure 8. Pinout bump side view (WLCSP36 package)

**Table 3. Pins description**

| Pin number |         | Pin name (function after reset) | Pin type | I/O structure | Alternate functions                                                          | Additional functions            |
|------------|---------|---------------------------------|----------|---------------|------------------------------------------------------------------------------|---------------------------------|
| QFN32      | WLCSP36 |                                 |          |               |                                                                              |                                 |
| 1          | C6      | PB3                             | I/O      | FT_a          | USART_CTS, LPUART_TX, SPI3_SCK, TIM2_CH4, TIM17_CH1, ANTENNA_ID[3], I2S3_SCK | ADC_VINP0, wakeup               |
| 2          | D5      | PB2                             | I/O      | FT_a          | USART_RTS_DE, TIM2_CH3, TIM16_BK                                             | ADC_VINM0, wakeup               |
| 3          | E6      | PB1                             | I/O      | FT_a          | USART_CK, TIM2_ETR, TIM16_CH1N, ANTENNA_ID[1]                                | ADC_VINP1, wakeup               |
| 4          | D7      | PB0                             | I/O      | FT_a          | USART_RX, LPUART_RTS_DE, TIM16_CH1, ANTENNA_ID[0]                            | ADC_VINM1, wakeup               |
| 5          | H5      | PA3                             | I/O      | FT_a          | SWCLK, USART_RTS_DE, SPI3_SCK, TIM2_CH2, TIM16_CH1N, I2S3_SCK                | ADC_VINP2, wakeup               |
| 6          | G6      | PA2                             | I/O      | FT_a          | SWDIO, USART_CK, SPI3_MCK, TIM2_CH1, TIM16_CH1, I2S3_MCK                     | ADC_VINM2, wakeup               |
| 7          | F7      | PA1                             | I/O      | FT_f          | I2C1_SDA, IR_OUT, USART_TX, TIM2_CH4                                         | Wakeup                          |
| 8          | H7      | PA0                             | I/O      | FT_f          | I2C1_SCL, USART_CTS, IR_OUT, TIM2_CH3                                        | Wakeup                          |
| 9          | M7      | PA8                             | I/O      | FT            | USART_RX, RX_SEQUENCE, SPI3_MISO, TIM2_CH3, TIM16BK, I2S3_MISO               | Wakeup, RTC_OUT                 |
| 10         | J6      | PA9                             | I/O      | FT            | USART_TX, RTC_OUT, SPI3_NSS, TIM2_CH4, TIM17_CH1, I2S3_WS                    | Wakeup                          |
| 11         | K5      | PA10                            | I/O      | FT            | LPUART_CTS, TX_SEQUENCE, SPI3_MCK, TIM17_CH1N, I2S3_MCK                      | Wakeup, LCO                     |
| 12         | J4      | PA11                            | I/O      | FT            | MCO, RX_SEQUENCE, SPI3_MOSI, TIM17_BK, I2S3_SD                               | Wakeup                          |
| 13         | A6      | VDD2                            | S        | -             | -                                                                            | 1.7-3.6 battery voltage input   |
| 14         | M5      | RF1                             | I/O      | RF            | -                                                                            | RF input/output. Impedance 50 Ω |
| 15         | L2      | VDDRF                           | S        | -             | -                                                                            | 1.7-3.6 battery voltage input   |
| 16         | M1      | OSCOUT                          | I/O      | FT_a          | -                                                                            | 32 MHz crystal                  |
| 17         | K1      | OSCIN                           | I/O      | FT_a          | -                                                                            | 32 MHz crystal                  |
| 18         | F3      | PB15                            | I/O      | FT_a          | USART_RX                                                                     | Wakeup                          |
| 19         | E2      | PB14                            | I/O      | FT_a          | TX_SEQUENCE, I2C1_SDA, TIM2_ETR, MCO, USART_RX                               | PVD_IN, Wakeup                  |
| 20         | D3      | PB13                            | I/O      | FT_a          | TIM2_CH4                                                                     | SXTAL1, Wakeup                  |

### 3 Memory mapping

Program memory, data memory and registers are organized within the same linear 4-Gbyte address space.

Figure 9. Memory map

## 4 Application circuits

The schematics below are purely indicative.

**Figure 10. Application circuit: DC-DC converter, WLCSP36 package**

**Figure 11. Application circuit: DC-DC converter, QFN32 package**

**Table 7. Application circuit external components**

| Component | Description                      |
|-----------|----------------------------------|
| C1        | Decoupling capacitor             |
| C2        | Decoupling capacitor             |
| C3        | Decoupling capacitor             |
| C4        | Decoupling capacitor             |
| C5        | Decoupling capacitor             |
| C6        | Decoupling capacitor             |
| C7        | Main LDO capacitor               |
| C8        | DC-DC converter output capacitor |
| C9        | DC-DC converter output capacitor |
| C10       | DC block capacitor               |
| C12       | RF Matching capacitor            |
| C13       | RF Matching capacitor            |
| C14       | RF Matching capacitor            |
| C15       | 32 kHz crystal loading capacitor |
| C16       | 32 kHz crystal loading capacitor |
| L1        | DC-DC converter output inductor  |
| L2        | DC-DC converter noise filter     |
| L3        | RF matching inductor             |
| L4        | RF matching inductor             |
| X1        | Low speed crystal                |
| X2        | High speed crystal               |
| U1        | BlueNRG-LPS                      |

**Note:** *In order to make the board DC-DC OFF, the inductance L1 must be removed and the supply voltage must be applied to the VFBS pin.*

## 5 Electrical characteristics

### 5.1 Parameter conditions

Unless otherwise specified, all voltages are referenced to ground (GND).

#### 5.1.1 Minimum and maximum values

Unless otherwise specified, the minimum and maximum values are guaranteed in the following standard conditions:

- Ambient temperature is  $T_A = 25\text{ }^{\circ}\text{C}$
- Supply voltage is  $V_{DD} = 3.3\text{ V}$
- System clock frequency is 32 MHz (clock source HSI)
- SMPS clock frequency is 4 MHz

Data based on characterization results, design simulation and/or technology characteristics are indicated in the table footnotes and are not tested in production. Based on characterization, the minimum and maximum values refer to sample tests and represent the mean value plus or minus three times the standard deviation (mean  $\pm 3\sigma$ ).

#### 5.1.2 Typical values

Unless otherwise specified, typical data are based on  $T_A = 25\text{ }^{\circ}\text{C}$ ,  $V_{DD} = 3.3\text{ V}$ . They are given only as design guidelines and are not tested.

Typical ADC accuracy values are determined by characterization of a batch of samples from a standard diffusion lot over the full temperature range, where 95% of the devices have an error less than or equal to the value indicated (mean  $\pm 2\sigma$ ).

#### 5.1.3 Typical curves

Unless otherwise specified, all typical curves are only given as design guidelines and are not tested.

#### 5.1.4 Loading capacitor

The loading conditions used for pin parameter measurement are shown in the figure below.

**Figure 12. Pin loading conditions**

### 5.1.5 Pin input voltage

The input voltage measurement on a pin of the device is described in the figure below.

Figure 13. Pin input voltage

## 5.2 Absolute maximum ratings

Stresses above the absolute maximum ratings listed in the tables below, may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these conditions is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability.

Table 8. Voltage characteristics

| Symbol                               | Ratings                                                              | Min. | Max.  | Unit |
|--------------------------------------|----------------------------------------------------------------------|------|-------|------|
| VDD1, VDD2, VDD3, VDD4, VDDRF, VDDSD | DC-DC converter supply voltage input and output                      | -0.3 | +3.9  | V    |
| VDDA_VCAP                            | DC voltage on linear voltage regulator                               | -0.3 | +1.32 |      |
| FXTALOUT, FXTALIN                    | DC Voltage on HSE                                                    | -0.3 | 1.32  |      |
| PA0 to PA15, PB0 to PB15             | DC voltage on digital input/output pins                              | -0.3 | +3.9  |      |
| VLXSD, VFBS                          | DC voltage on analog pins                                            | -0.3 | +3.6  |      |
| XTAL0/PB12, XTAL1/PB13               | DC voltage on XTAL pins                                              | -0.3 | +1.4  |      |
| RF1                                  | DC voltage on RF pin                                                 |      |       |      |
| $ \Delta V_{DD} $                    | Variations between different $V_{DDX}$ power pins of the same domain |      | 50    | mV   |

**Note:** All the main power and ground pins must always be connected to the external power supply, in the permitted range.

**Table 9. Current characteristics**

| Symbol                  | Ratings                                                          | Max. | Unit |
|-------------------------|------------------------------------------------------------------|------|------|
| $\Sigma I_{VDD}$        | Total current into sum of all VDD power lines (source)           | 130  | mA   |
| $\Sigma I_{V_{GND}}$    | Total current out of sum of all ground lines (sink)              | 130  |      |
| $I_{VDD(PIN)}$          | Maximum current into each VDD power pin (source)                 | 100  |      |
| $I_{V_{GND}(PIN)}$      | Maximum current out of each ground pin (sink)                    | 100  |      |
| $I_{IO(PIN)}$           | Output current sunk by any I/O and control pin                   | 20   |      |
|                         | Output current sourced by any I/O and control pin                | 20   |      |
| $\Sigma I_{IO(PIN)}$    | Total output current sunk by sum of all I/Os and control pins    | 100  |      |
|                         | Total output current sourced by sum of all I/Os and control pins | 100  |      |
| $\Sigma  I_{INJ(PIN)} $ | Total injected current (sum of all I/Os and control pins)        | -5/0 |      |

**Table 10. Thermal characteristics**

| Symbol    | Ratings                      | Value       | Unit |
|-----------|------------------------------|-------------|------|
| $T_{STG}$ | Storage temperature range    | -40 to -125 | °C   |
| $T_J$     | Maximum junction temperature | 125         |      |

## 5.3 Operating conditions

### 5.3.1 Summary of main performance

### 5.3.2 General operating conditions

**Table 14. General operating conditions**

| Symbol              | Parameter                                                  | Conditions                | Min.             | Max.    | Unit |
|---------------------|------------------------------------------------------------|---------------------------|------------------|---------|------|
| f <sub>HCLK</sub>   | Internal AHB clock frequency                               |                           | 1                | 64      | MHz  |
| f <sub>PCLK0</sub>  | Internal APB0 clock                                        |                           | 1                | 64      |      |
| f <sub>PCLK1</sub>  | Internal APB1 clock frequency                              |                           | 1 <sup>(1)</sup> | 64      |      |
| f <sub>PCLK2</sub>  | Internal APB2 clock frequency                              |                           | 16               | 32      |      |
| V <sub>DD</sub>     | Standard operating voltage                                 |                           | 1.7              | 3.6     | V    |
| V <sub>FBSMPS</sub> | SMPS feedback voltage                                      |                           | 1.4              | 3.6     |      |
| V <sub>DDRF</sub>   | Minimum RF voltage                                         |                           | 1.7              | 3.6     |      |
| V <sub>IN</sub>     | I/O input voltage                                          |                           | -0.3             | VDD+0.3 |      |
| P <sub>D</sub>      | Power dissipation at T <sub>A</sub> =105 °C <sup>(2)</sup> | QFN32 package             |                  | 30      | mW   |
| T <sub>A</sub>      | Ambient temperature                                        | Maximum power dissipation | -40              | 105     | °C   |
| T <sub>J</sub>      | Junction temperature range                                 |                           | -40              | 105     |      |

1. It could be 0 if all the peripherals are disabled.

2. T<sub>A</sub> cannot exceed T<sub>J</sub> max.

### 5.3.3 RF general characteristics

All performance data are referred to a 50 Ω antenna connector, via reference design.

**Table 15. Bluetooth Low Energy RF general characteristics**

| Symbol             | Parameter                                                        | Test conditions                                                         | Min. | Typ. | Max.   | Unit |
|--------------------|------------------------------------------------------------------|-------------------------------------------------------------------------|------|------|--------|------|
| F <sub>RANGE</sub> | Frequency range <sup>(1)</sup>                                   |                                                                         | 2400 |      | 2483.5 | MHz  |
| RF <sub>CH</sub>   | RF channel center frequency <sup>(1)</sup>                       |                                                                         | 2402 |      | 2480   |      |
| PLL <sub>RES</sub> | RF channel spacing <sup>(1)</sup>                                |                                                                         |      | 2    |        | MHz  |
| ΔF                 | Frequency deviation <sup>(1)</sup>                               |                                                                         |      | 250  |        | kHz  |
| Δf <sub>1</sub>    | Frequency deviation average <sup>(1)</sup>                       |                                                                         | 450  |      | 550    | kHz  |
| C <sub>Fdev</sub>  | Center frequency deviation <sup>(1)</sup>                        | During the packet and including both initial frequency offset and drift |      |      | ±150   | kHz  |
| Δfa                | Frequency deviation Δf2 (average) / Δf1 (average) <sup>(1)</sup> |                                                                         | 0.80 |      |        |      |
| R <sub>gfsk</sub>  | On-air data rate <sup>(1)</sup>                                  |                                                                         | 1    |      | 2      | Mbps |
| STacc              | Symbol time accuracy <sup>(1)</sup>                              |                                                                         |      |      | ±50    | ppm  |
| MOD                | Modulation scheme                                                |                                                                         | GFSK |      |        |      |
| BT                 | Bandwidth-bit period product                                     |                                                                         |      | 0.5  |        |      |
| Mindex             | Modulation index <sup>(1)</sup>                                  |                                                                         | 0.45 | 0.5  | 0.55   |      |
| PMAX               | Maximum output                                                   | At antenna connector, VSMPS = 1.9 V, LDO code                           |      | +8   |        | dBm  |
| PMIN               | Minimum output                                                   | At antenna connector                                                    |      | -20  |        | dBm  |
| PRFC               | RF power accuracy                                                | @ 27 °C                                                                 |      | ±1.5 |        | dB   |
|                    |                                                                  | All temperatures                                                        |      | ±2.5 |        |      |

1. Tested according to Bluetooth SIG radio frequency physical layer (RF PHY) test suite (not tested in production).

### 5.3.4 RF transmitter characteristics

All performance data are referred to a 50 Ω antenna connector, via reference design.

**Table 16. Bluetooth Low Energy RF transmitter characteristics at 1 Mbps not coded**

| Symbol                    | Parameter                                                     | Test conditions                                                              | Min. | Typ. | Max. | Unit      |
|---------------------------|---------------------------------------------------------------|------------------------------------------------------------------------------|------|------|------|-----------|
| P <sub>BW1M</sub>         | 6 dB bandwidth for modulated carrier                          | Using resolution bandwidth of 100 kHz                                        | 500  |      |      | kHz       |
| P <sub>RF1</sub> , 1 Ms/s | In-band emission at ±2 MHz <sup>(1)</sup>                     | Using resolution bandwidth of 100 kHz and average detector                   |      |      | -20  | dBm       |
| P <sub>RF2</sub> , 1 Ms/s | In-band emission at ±[3+n]MHz, where n=0,1,2.. <sup>(1)</sup> | Using resolution bandwidth of 100 kHz and average detector                   |      |      | -30  | dBm       |
| P <sub>SPUR</sub>         | Spurious emission                                             | Harmonics included. Using resolution bandwidth of 1 MHz and average detector |      |      | -41  | dBm       |
| Freq <sub>drift</sub>     | Frequency drift <sup>(1)</sup>                                | Integration interval #n – integration interval #0, where n=2,3,4..k          | -50  |      | +50  | kHz       |
| IFreq <sub>drift</sub>    | Initial carrier frequency drift <sup>(1)</sup>                | Integration interval #1 – integration interval #0                            | -23  |      | +23  | kHz       |
| Int <sub>Freqdrift</sub>  | Intermediate carrier frequency drift <sup>(1)</sup>           | Integration interval #n – integration interval #(n-5), where n=6,7,8..k      | -20  |      | +20  | kHz       |
| Drift Rate max            | Maximum drift rate <sup>(1)</sup>                             | Between any two 10-bit groups separated by 50 μs                             | -20  |      | +20  | kHz/50 μs |
| Z <sub>RF1</sub>          | Optimum RF load (impedance at RF1 pin)                        | @ 2440 MHz                                                                   |      | 40   |      | Ω         |

1. Tested according to Bluetooth SIG radio frequency physical layer (RF PHY) test suite (not tested in production).

**Table 17. Bluetooth Low Energy RF transmitter characteristics at 2 Mbps not coded**

| Symbol                    | Parameter                                                    | Test conditions                                                              | Min. | Typ. | Max. | Unit           |
|---------------------------|--------------------------------------------------------------|------------------------------------------------------------------------------|------|------|------|----------------|
| P <sub>BW1M</sub>         | 6 dB bandwidth for modulated carrier                         | Using resolution bandwidth of 100 kHz                                        | 670  |      |      | kHz            |
| P <sub>RF1</sub> , 2 Ms/s | In-band emission at $\pm 4$ MHz <sup>(1)</sup>               | Using resolution bandwidth of 100 kHz and average detector                   |      |      | -20  | dBm            |
| P <sub>RF2</sub> , 2 Ms/s | In-band emission at $\pm 5$ MHz <sup>(1)</sup>               | Using resolution bandwidth of 100 kHz and average detector                   |      |      | -20  | dBm            |
| P <sub>RF3</sub> , 2 Ms/s | In-band emission at $\pm [6+n]$ MHz, where $n=0,1,2..^{(1)}$ | Using resolution bandwidth of 100 kHz and average detector                   |      |      | -30  | dBm            |
| P <sub>SPUR</sub>         | Spurious emission                                            | Harmonics included. Using resolution bandwidth of 1 MHz and average detector |      |      | -41  | dBm            |
| Freq <sub>drift</sub>     | Frequency drift <sup>(1)</sup>                               | Integration interval #n – integration interval #0, where $n=2,3,4..k$        | -50  |      | +50  | kHz            |

### 5.3.7 Supply current characteristics

The current consumption is a function of several parameters and factors such as: the operating voltage, ambient temperature, I/O pin loading, device software configuration, operating frequencies, I/O pin switching rate, program location in memory and executed binary code.

The MCU is put under the following conditions:

- All I/O pins are in analog input mode
- All peripherals are disabled except when explicitly mentioned
- The Flash memory access time is adjusted with the minimum wait states number
- When the peripherals are enabled  $f_{PCLK} = f_{HCLK}$

**Table 24. Current consumption**

| Symbol                     | Parameter                                 | Conditions                                             | Typ.  |       |        | Unit |
|----------------------------|-------------------------------------------|--------------------------------------------------------|-------|-------|--------|------|
|                            |                                           |                                                        | 25 °C | 85 °C | 105 °C |      |

1. The current consumption in DEEPSTOP is measured considering the entire SRAM retained.

### 5.3.8 Wake-up time from low power modes

The wake-up times reported are the latency between the event and the execution of the instruction. The device goes to low-power mode after WFI (wait for interrupt) instructions.

**Table 25. Low power mode wake-up timing**

| Symbol                  | Parameter                                   | Conditions                                 | Typ. | Unit |
|-------------------------|---------------------------------------------|--------------------------------------------|------|------|
| T <sub>WUDEEPSTOP</sub> | Wake-up time from DEEPSTOP mode to RUN mode | Wake-up from GPIO VDD = 3.3 V Flash memory | 170  | μs   |

### 5.3.9 High speed crystal requirements

The high speed external oscillator must be supplied with an external 32 MHz crystal that is specified for a 6 to 8 pF loading capacitor. The BlueNRG-LPS includes internal programmable capacitances that can be used to tune the crystal frequency in order to compensate the PCB parasitic one. These internal load capacitors are made by a fixed one, in parallel with a 6-bit binary weighted capacitor bank. Thanks to low CL step size (1-bit is typically 0.07 pF), very fine crystal tuning is possible. With a typical XTAL sensitivity of -14 ppm/pF, it is possible to trim a 32 MHz crystal, with a resolution of 1 ppm.

The requirements for the external 32 MHz crystal are reported in the table below.

**Table 26. HSE crystal requirements**

| Symbol           | Parameter                                | Conditions                                                                                                           | Min.             | Typ.             | Max.               | Unit |
|------------------|------------------------------------------|----------------------------------------------------------------------------------------------------------------------|------------------|------------------|--------------------|------|
| f <sub>NOM</sub> | Oscillator frequency                     |                                                                                                                      |                  | 32               |                    | MHz  |
| f <sub>TOL</sub> | Frequency tolerance                      | Includes initial accuracy, stability over temperature, aging and frequency pulling due to incorrect load capacitance |                  |                  | ±50                | ppm  |

**Table 29. LSI oscillator characteristics**

| Symbol                                         | Parameter                        | Conditions         | Min. | Typ. | Max. | Unit              |
|------------------------------------------------|----------------------------------|--------------------|------|------|------|-------------------|
| $f_{\text{NOM}}$                               | Nominal frequency                |                    |      | 33   |      | kHz               |
| $\Delta f_{\text{RO\_}\Delta T}/f_{\text{RO}}$ | Frequency spread vs. temperature | Standard deviation |      | 140  |      | ppm/ $^{\circ}$ C |

### 5.3.13 PLL characteristics

Characteristics measured over recommended operating conditions unless otherwise specified.

**Table 30. PLL characteristics**

| Symbol                   | Parameter              | Conditions                                                          | Min. | Typ. | Max. | Unit    |
|--------------------------|------------------------|---------------------------------------------------------------------|------|------|------|---------|
| $PN_{\text{SYNTH}}$      | RF carrier phase noise | At $\pm 1$ MHz offset from carrier<br>(measured at 2.4 GHz)         |      | -110 |      | dBc/Hz  |
|                          |                        | At 2.4 GHz $\pm 3$ MHz offset from carrier<br>(measured at 2.4 GHz) |      | -114 |      | dBc/Hz  |
|                          |                        | At 2.4 GHz $\pm 6$ MHz offset from carrier<br>(measured at 2.4 GHz) |      | -128 |      | dBc/Hz  |
|                          |                        | At $\pm 25$ MHz offset from carrier                                 |      | -135 |      | dBc/Hz  |
| $LOCK_{\text{TIMETX}}$   | PLL lock time to TX    | With calibration @2.5 ppm                                           |      | 150  |      | $\mu$ s |
| $LOCK_{\text{TIMERX}}$   | PLL lock time to RX    | With calibration @2.5 ppm                                           |      | 110  |      | $\mu$ s |
| $LOCK_{\text{TIMERXTX}}$ | PLL lock time RX to TX | Without calibration @2.5 ppm                                        |      | 47   |      | $\mu$ s |
| $LOCK_{\text{TIMETXRX}}$ | PLL lock time TX to RX | Without calibration @2.5 ppm                                        |      | 32   |      | $\mu$ s |

### 5.3.14 Flash memory characteristics

The characteristics below are guaranteed by design.

**Table 31. Flash memory characteristics**

| Symbol                   | Parameter                       | Test conditions | Typ. | Max. | Unit          |
|--------------------------|---------------------------------|-----------------|------|------|---------------|
| $t_{\text{prog}}$        | 32-bit programming time         |                 | 20   | 40   | $\mu\text{s}$ |
| $t_{\text{prog\_burst}}$ | 4x32-bit burst programming time |                 | 4x20 | 4x40 |               |
| $t_{\text{ERASE}}$       | Page (2 kbyte) erase time       |                 | 20   | 40   | ms            |
| $t_{\text{ME}}$          | Mass erase time                 |                 | 20   | 40   |               |
| $I_{\text{DD}}$          | Average consumption from VDD    | Write mode      | 3    |      | mA            |
|                          |                                 | Erase mode      | 3    |      |               |
|                          |                                 | Mass erase      | 5    |      |               |

**Table 32. Flash memory endurance and data retention**

| Symbol           | Parameter      | Test conditions                             | Min. | Unit    |
|------------------|----------------|---------------------------------------------|------|---------|
| $N_{\text{END}}$ | Endurance      | $T_A = -40$ to $+105\text{ }^\circ\text{C}$ | 10   | kcycles |
| $t_{\text{RET}}$ | Data retention | $T_A = 105\text{ }^\circ\text{C}$           | 10   | Years   |

### 5.3.15 Electrostatic discharge (ESD)

Electrostatic discharges (a positive then a negative pulse separated by 1 second) are applied to the pins of each sample according to each pin combination. The sample size depends on the number of supply pins in the device (3 parts x (n + 1) supply pins). This test conforms to the ANSI/JEDEC standard.

**Table 33. ESD absolute maximum ratings**

| Symbol                | Parameter                                             | Conditions                              | Class | Max. <sup>(1)</sup> | Unit |
|-----------------------|-------------------------------------------------------|-----------------------------------------|-------|---------------------|------|
| $V_{\text{ESD(HBM)}}$ | Electrostatic discharge voltage (human body model)    | Conforming to ANSI/ESDA/JEDEC JS-001    | 2     | 2000                | V    |

1. Guaranteed by design.

### 5.3.16 I/O port characteristics

Unless otherwise specified, the parameters given in the tables below are derived from tests performed under the conditions summarized in Table 14. General operating conditions. All I/Os are designed as CMOS-compliant.

**Table 34. I/O static characteristics**

| Symbol           | Parameter                    | Conditions                                                                                               | Min.                       | Typ. | Max.                       | Unit       |
|------------------|------------------------------|----------------------------------------------------------------------------------------------------------|----------------------------|------|----------------------------|------------|
| $V_{\text{IL}}$  | I/O input low level voltage  | $1.62\text{ V} < V_{\text{DD}} < 3.6\text{ V}$                                                           |                            |      | $0.3 \times V_{\text{DD}}$ | V          |
| $V_{\text{IH}}$  | I/O input high level voltage |                                                                                                          | $0.7 \times V_{\text{DD}}$ |      |                            |            |
| $I_{\text{Ikg}}$ | Input leakage current        | $0 \leq V_{\text{IN}} \leq \text{Max}(V_{\text{DDx}})^{(1)}$                                             |                            |      | +/-100                     | nA         |
|                  |                              | $\text{Max}(V_{\text{DDx}})^{(1)} \leq V_{\text{IN}} \leq \text{Max}(V_{\text{DDx}})^{(1)} + 1\text{ V}$ |                            |      | 650                        |            |
|                  |                              | $\text{Max}(V_{\text{DDx}})^{(1)} + 1\text{ V} < V_{\text{IN}} \leq 5.5\text{ V}$                        |                            |      | 200                        |            |
| $R_{\text{PU}}$  | Pull-up resistor             | $V_{\text{IN}} = \text{GND}$                                                                             | 25                         | 40   | 55                         | k $\Omega$ |
| $R_{\text{PD}}$  | Pull-down resistor           | $V_{\text{IN}} = V_{\text{DD}}$                                                                          | 25                         | 40   | 55                         |            |

| Symbol   | Parameter           | Conditions | Min. | Typ. | Max. | Unit |
|----------|---------------------|------------|------|------|------|------|
| $C_{IO}$ | I/O pin capacitance |            |      | 5    |      | pF   |

1.  $Max(VDDx)$  is the maximum value among all the I/O supplies.

All I/Os are CMOS-compliant (no software configuration required).

GPIOs (general purpose input/outputs) can sink or source up to  $\pm 8$  mA and sink or source up to  $\pm 20$  mA (with a relaxed  $V_{OL}$  /  $V_{OH}$ ).

In the user application, the number of I/O pins that can drive current must be limited to respect the absolute maximum rating specified.

- The sum of currents sourced by all I/Os on VDD, plus the maximum consumption of MCU sourced on VDD, cannot exceed the absolute maximum rating  $\Sigma IVDD$
- The sum of currents sunk by all I/Os on VSS, plus the maximum consumption of the MCU sunk on GND, cannot exceed the absolute maximum rating  $\Sigma IVGND$ .

**Table 35. Output voltage characteristics**

| Symbol   | Parameter                             | Conditions                                                  | Min.       | Max. | Unit |
|----------|---------------------------------------|-------------------------------------------------------------|------------|------|------|
| $V_{OL}$ | Output low level voltage for I/O pin  | CMOS port <sup>(1)</sup> $ I_{IO}  = 8$ mA $VDD \geq 2.7$ V |            | 0.4  | V    |
| $V_{OH}$ | Output high level voltage for I/O pin |                                                             | VDD - 0.4  |      |      |
| $V_{OL}$ | Output low level voltage for I/O pin  | $ I_{IO}  = 20$ mA $VDD \geq 2.7$ V                         |            | 1.3  |      |
| $V_{OH}$ | Output high level voltage for I/O pin |                                                             | VDD - 1.3  |      |      |
| $V_{OL}$ | Output low level voltage for I/O pin  | $ I_{IO}  = 4$ mA $VDD \geq 1.62$ V                         |            | 0.4  |      |
| $V_{OH}$ | Output high level voltage for I/O pin |                                                             | VDD - 0.45 |      |      |

1. CMOS outputs are compatible with JEDEC standards JESD36 and JESD52.

### 5.3.17

#### RSTN pin characteristics

The RSTN pin input driver uses CMOS technology. It is connected to a permanent pull-up resistor, RPU.

Unless otherwise specified, the parameters given in the table below are derived from tests performed under the ambient temperature and supply voltage conditions summarized in .

**Table 36. RSTN pin characteristics**

| Symbol          | Parameter                               | Test conditions | Min.             | Typ. | Max.             | Unit.      |
|-----------------|-----------------------------------------|-----------------|------------------|------|------------------|------------|
| $V_{IL(RSTN)}$  | RSTN input low level voltage            |                 |                  |      | $0.3 \times VDD$ | V          |
| $V_{IH(RSTN)}$  | RSTN input high level voltage           |                 | $0.7 \times VDD$ |      |                  |            |
| $V_{hys(RSTN)}$ | RSTN Schmitt trigger voltage hysteresis |                 |                  | 200  |                  | mV         |
| RPU             | Weak pull-up equivalent resistor        | $V_{IN} = GND$  | 25               | 40   | 55               | k $\Omega$ |

### Figure 14. Recommended RSTN pin protection

*Note:* The external reset circuit protects the device against parasitic resets. The user must ensure that the level on the RSTN pin can go below the  $V_{IL}(RSTN)$  max. level specified in the table, otherwise the reset is not taken into account by the device. The external capacitor on RSTN must be placed as close as possible to the device.

### 5.3.18 ADC characteristics

**Table 37. ADC characteristics (HSI must be set to PLL mode)**

| Symbol                    | Parameter                                | Test conditions                     | Min. | Typ. | Max. | Units       |
|---------------------------|------------------------------------------|-------------------------------------|------|------|------|-------------|
| Channels Diff             | Number of channels for differential mode | QFN32, WLCSP36                      |      |      | 4    |             |
| Channels SE               | Number of channels for single ended mode | QFN32, WLCSP36                      |      |      | 8    |             |
| IBAT <sub>ADCBIAS</sub>   | ADC biasing consumption at battery       | Biasing blocks turned on            |      | 145  |      | μA          |
| IBAT <sub>ADCACTIVE</sub> | ADC active consumption at battery        | ADC activated in differential mode  |      | 185  |      | μA          |
| VDDA_VCAP                 | Analog supply voltage                    |                                     | 1.2  |      | 1.32 | V           |
| R <sub>AIN</sub>          | Input impedance                          | In DC                               |      | 250  |      | kΩ          |
| R <sub>in</sub>           | Internal access resistance               | VBOOST is enabled for VDD < 2.7 V   |      |      | 550  | Ω           |
| C <sub>in</sub>           | Input sampling capacitor                 |                                     |      | 4    |      | pF          |
| T <sub>s</sub>            | Sampling period                          | Default configuration               |      | 1    |      | μs          |
| T <sub>sw</sub>           | Sampling time                            | Default configuration               |      | 125  |      | ns          |
| DR                        | Output data rate                         |                                     |      | 200  |      | k samples/s |
| FRMT <sub>output</sub>    | Output data format                       |                                     |      | 16   |      | bits        |
| TL                        | Latency time                             | 200 kSps                            |      | 5    |      | μs          |
| T <sub>STARTUP</sub>      | Start-up time                            | From ADC enable to conversion start |      |      | 1    | μs          |
| DNL                       | Differential non-linearity               |                                     |      | ±0.7 |      | bit         |
| INL                       | Integral non-linearity                   |                                     |      | ±1   |      | bit         |

| Symbol    | Parameter                          | Test conditions                                                                 | Min. | Typ. | Max. | Units |
|-----------|------------------------------------|---------------------------------------------------------------------------------|------|------|------|-------|
| SNR Diff  | Signal to noise ratio              | Differential input<br>@1 kHz, -1 dBFs, Fs = 800 kHz, DS=4                       |      | 72   |      | dB    |
| STHD Diff | Signal to THD ratio (10 harmonics) | Differential input<br>@1 kHz, -1 dBFs, Fs = 800 kHz, DS = 4                     |      | 75   |      | dB    |
| ENOB Diff | Effective number of bits           | Differential input<br>@1 kHz, -1 dBFs, Fs = 800 kHz, DS = 4                     |      | 11.5 |      | bits  |
| SNR SE    | Signal-to-noise ratio              | Single ended<br>@1 kHz, -1 dBFs, Fs = 800 kHz, DS = 4                           |      | 70   |      | dB    |

| ENOB SE   | Effective number of bits           | Single ended<br>@1 kHz, -1 dBFs, Fs = 800 kHz, DS = 4                           |      | 11   |      | bits  |
|           | ADC_ERR_1V7                        | Absolute error when used for battery measurements at 1.7 V, 2.4 V, 3.0 V, 3.6 V |      | 13   |      | mV    |
|           | ADC_ERR_2V4                        |                                                                                 |      | 0    |      |       |
|           | ADC_ERR_3V0                        |                                                                                 |      | -9   |      |       |
|           | ADC_ERR_3V6                        |                                                                                 |      | -22  |      |       |

### 5.3.19 Temperature sensor characteristics

**Table 38. Temperature sensor characteristics**

| Symbol              | Parameter                       | Conditions | Min. | Typ. | Max. | Unit   |
|---------------------|---------------------------------|------------|------|------|------|--------|
| T <sub>ERR</sub>    | Error in temperature            |            |      | ±4   |      | °C     |
| T <sub>SLOPE</sub>  | Average temperature coefficient |            |      | 8    |      | bit/°C |
| T <sub>ICC</sub>    | Current consumption with AUXADC |            |      | 415  |      | µA     |
| T <sub>TS-OUT</sub> | Output code at 30 °C (+/-5 °C)  |            |      | 2533 |      | bit    |

### 5.3.20 Timer characteristics

**Table 39. TIM2/16/17 characteristics**

| Symbol                 | Parameter                   | Test conditions               | Min.     | Typ.   | Max.  | Unit |
|------------------------|-----------------------------|-------------------------------|----------|--------|-------|------|
| t <sub>res(TIM)</sub>  | Timer resolution time       | f <sub>TIMxCLK</sub> = 64 MHz |          | 15.625 |       | ns   |
| R <sub>esTIM</sub>     | Timer resolution            |                               |          | 16     |       | bit  |
| t <sub>COUNTER</sub>   | 16-bit counter clock period | f <sub>TIMxCLK</sub> = 64 MHz | 0.015625 |        | 1024  | µs   |
| t <sub>MAX_COUNT</sub> | Maximum possible count time | f <sub>TIMxCLK</sub> = 64     |          |        | 67.10 | s    |

**Table 40. IWDG min./max. timeout period at 32 kHz (LSE)**

| Prescaler divider | PR[2:0] bits | Min. timeout RL[11:0] = 0x000 | Max. timeout RL[11:0] = 0xFFFF | Unit |
|-------------------|--------------|-------------------------------|--------------------------------|------|
| /4                | 0            | 0.125                         | 512                            | ms   |
| /8                | 1            | 0.250                         | 1024                           |      |
| /16               | 2            | 0.500                         | 2048                           |      |

| Prescaler divider | PR[2:0] bits | Min. timeout RL[11:0] = 0x000 | Max. timeout RL[11:0] = 0xFFFF | Unit |
|-------------------|--------------|-------------------------------|--------------------------------|------|
| /32               | 3            | 1.0                           | 4096                           | ms   |
| /64               | 4            | 2.0                           | 8192                           |      |
| /128              | 5            | 4.0                           | 16384                          |      |
| /256              | 6 or 7       | 8.0                           | 32768                          |      |

### 5.3.21 I<sup>2</sup>C interface characteristics

The I<sup>2</sup>C interface meets the timing requirements of the I<sup>2</sup>C-Bus specifications and user manual rev. 03 for:

- Standard-mode (Sm): bit rate up to 100 kbit/s
- Fast-mode (Fm): bit rate up to 400 kbit/s
- Fast-mode plus (Fm+): bit rate up to 1 Mbit/s

SDA and SCL I/O requirements are met with the following restrictions: SDA and SCL I/O pins are not “true” open-drain. When configured as open-drain, the PMOS connected between the I/O pin and VDD is disabled, but is still present. The 20 mA output drive requirement in fast-mode plus is supported partially.

This limits the maximum load  $C_{load}$  supported in fast-mode plus, given by these formulas:

- $t_r(SDA/SCL) = 0.8473 \times R_p \times C_{load}$
- $R_p(min.) = [V_{DD} - V_{OL(max)}] / I_{OL(max)}$

where  $R_p$  is the I<sup>2</sup>C lines pull-up.

All I<sup>2</sup>C SDA and SCL I/Os embed an analog filter.

**Table 41. I<sup>2</sup>C analog filter characteristics**

| Symbol | Parameter                                                              | Min. | Max. | Unit |
|--------|------------------------------------------------------------------------|------|------|------|
| tAF    | Maximum pulse width of spikes that are suppressed by the analog filter | 50   | 110  | ns   |

### 5.3.22 SPI characteristics

The parameters for SPI are derived from tests performed according to  $f_{PCLKx}$  frequency and supply voltage conditions summarized in [Table 14. General operating conditions](#).

- Output speed is set to OSPEEDRy[1:0] = 11
- Capacitive load C = 30 pF
- Measurement points are done at CMOS levels:  $0.5 \times V_{DD}$

**Table 42. SPI characteristics**

| Symbol              | Parameter               | Conditions  | Min.                 | Typ.           | Max.               | Units |
|---------------------|-------------------------|-------------|----------------------|----------------|--------------------|-------|
| $f_{SCK}$           | SPI clock frequency     | Master mode |                      | -              | 32                 | MHz   |
|                     |                         | Slave mode  |                      |                | 32 <sup>(1)</sup>  |       |
| tsu(NSS)            | NSS setup time          |             | $4 / f_{PCLK}$       | -              | -                  | -     |
| th(NSS)             | NSS hold time           |             | $2 / f_{PCLK}$       | -              | -                  | -     |
| tw(SCKH), tw(SCKL)  | SCK high and low time   | Master mode | $1 / f_{PCLK} - 1.5$ | $1 / f_{PCLK}$ | $1 / f_{PCLK} + 1$ | ns    |

| th(MI)              | Data input hold time    | Master mode | 2                    | -              | -                  |       |
| th(SI)              | Data input hold time    | Slave mode  | 0                    | -              | -                  |       |
| t <sub>a</sub> (SO) | Data output access time | Slave mode  | 6                    | -              | 30                 |       |

| Symbol        | Parameter                | Conditions  | Min. | Typ. | Max. | Units |
|---------------|--------------------------|-------------|------|------|------|-------|
| $t_{dis(SO)}$ | Data output disable time | Slave mode  | 6    | -    | 32   | ns    |
| $t_{v(MO)}$   | Data output valid time   | Master mode | -    | 5    | 9    |       |
| $t_{v(SO)}$   |                          | Slave mode  | -    | 12   | 35   |       |
| $t_{h(MO)}$   | Data output hold time    | Master mode | 1    |      | -    |       |
| $t_{h(SO)}$   |                          | Slave mode  | 6    |      | -    |       |

1. The maximum frequency in slave transmitter mode is determined by the sum of  $t_{v(SO)}$  and  $t_{su(MI)}$ , which has to fit SCK low or high phase preceding the SCK sampling edge. This value can be achieved when the SPI communicates with a master having  $t_{su(MI)} = 0$  while  $duty(SCK) = 50\%$ .

## 6 Package information

In order to meet environmental requirements, ST offers these devices in different grades of **ECOPACK** packages, depending on their level of environmental compliance. ECOPACK specifications, grade definitions and product status are available at: [www.st.com](http://www.st.com). ECOPACK is an ST trademark.

### 6.3 Thermal characteristics

The maximum chip junction temperature ( $T_{Jmax.}$ ) must never exceed the values in general operating conditions.

The maximum chip-junction temperature,  $T_{Jmax.}$ , in degrees Celsius, can be calculated using the equation:

$$T_{Jmax.} = T_{Amax.} + (PD_{max} \times \theta_{JA})$$

where:

- $T_{Amax.}$  is the maximum ambient temperature in °C
- $\theta_{JA}$  is the package junction-to-ambient thermal resistance, in °C/W
- $PD_{max.}$  is the sum of  $P_{INTmax.}$  and  $P_{I/Omax.}$  ( $PD_{max.} = P_{INTmax.} + P_{I/Omax.}$ )
- $P_{INTmax.}$  is the product of  $I_{DD}$  and  $V_{DD}$ , expressed in Watt. This is the maximum chip internal power

$P_{I/Omax.}$  represents the maximum power dissipation on output pins:

- $P_{I/Omax.} = \sum (VOL \times IOL) + \sum ((V_{DD} - VOH) \times IOH)$

taking into account the actual VOL / IOL and VOH / IOH of the I/Os at low and high level in the applications.

*Note: When the SMPS is used, a portion of the power consumption is dissipated into the external inductor, therefore reducing the chip power dissipation. This portion depends mainly on the inductor ESR characteristics.*

*Note: As the radiated RF power is quite low (< 4 mW), it is not necessary to remove it from the chip power consumption.*

*Note: RF characteristics (such as: sensitivity, Tx power, consumption) are provided up to 85 °C.*

**Table 45. Package thermal characteristics**

| Symbol        | Parameter                                                     | Value | Unit |
|---------------|---------------------------------------------------------------|-------|------|
