

OMNIFET III fully protected low-side driver for automotive applications

Datasheet - production data

Features

Type	V_{clamp}	$R_{\text{DS(on)}}$	I_D
VNLD5090-E	41 V	90 mΩ	25 A

- AEC-Q100 qualified 
- Drain current: 13 A
- ESD protection
- Overvoltage clamp
- Thermal shutdown
- Current and power limitation
- Very low standby current
- Very low electromagnetic susceptibility
- In compliance with the 2002/95/EC European directive

Description

The VNLD5090-E is a monolithic device made using STMicroelectronics VIPower technology, intended for driving resistive or inductive loads with one side connected to the battery. Built-in thermal shutdown protects the chip from overtemperature and short-circuit. Output current limitation protects the device in an overload condition. In case of long duration overload, the device limits the dissipated power to a safe level up to thermal shutdown intervention. Thermal shutdown, with automatic restart, allows the device to recover normal operation as soon as a fault condition disappears. Fast demagnetization of inductive loads is achieved at turn-off.

2 Electrical specifications

2.1 Absolute maximum ratings

Stressing the device above the rating listed in the [Table 4](#) may cause permanent damage to the device. These are stress ratings only and operation of the device at these or any other conditions above those indicated in the operating sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

Figure 5. Application schematic

3.1 MCU I/O protection

ST suggests to insert a resistor (R_{prot}) in line to prevent the microcontroller I/O pins from latching up^(a). The value of these resistors is a compromise between the leakage current of microcontroller and the current required by the LSD I/Os (input levels compatibility) with the latch-up limit of microcontroller I/Os:

Equation 1

$$\frac{0.7}{I_{latchup}} \leq R_{prot} \leq \frac{(V_{O\text{H}\mu\text{C}} - V_{I\text{H}})}{I_{I\text{H max}}}$$

Let:

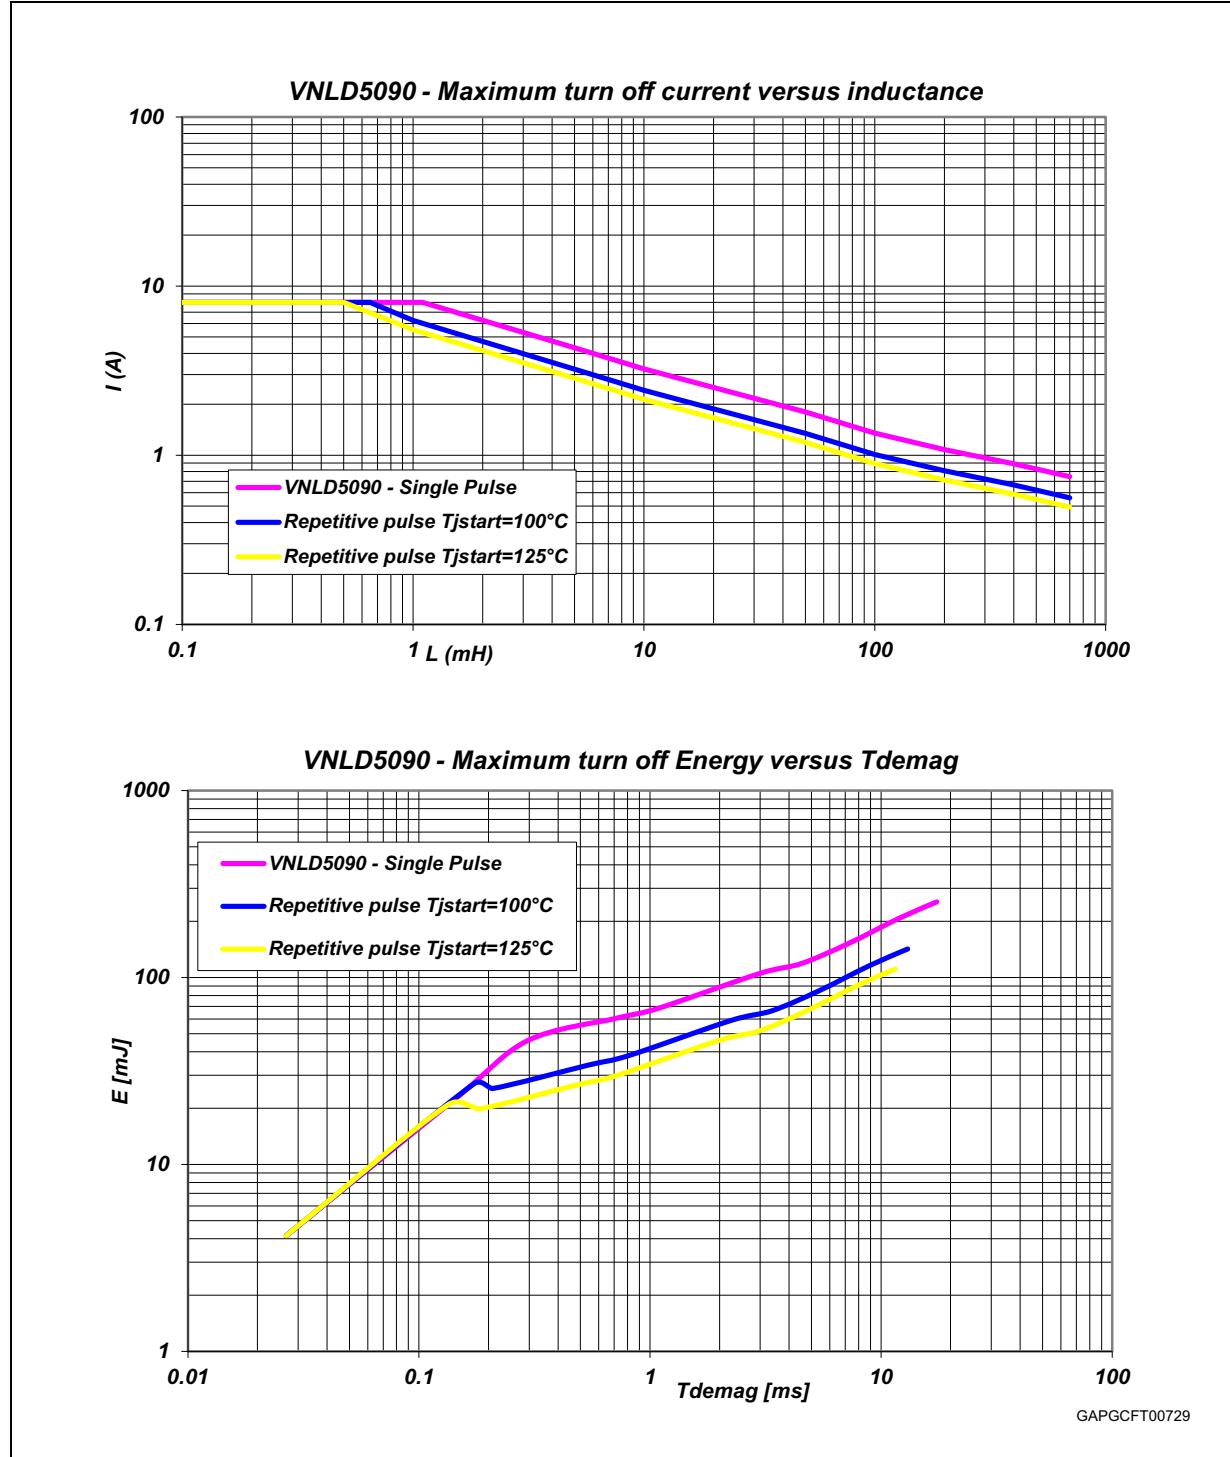

- $I_{latchup} \geq 20 \text{ mA}$
- $V_{O\text{H}\mu\text{C}} \geq 4.5 \text{ V}$
- $35 \Omega \leq R_{prot} \leq 100 \text{ k}\Omega$

a. In case of negative transient on the drain pin.

Then, the recommended value is $R_{\text{prot}} = 1 \text{ k}\Omega$

[Figure 6](#) shows the turn-off current drawn during the demagnetization.

Note:

The fitting model is a simplified thermal tool and is valid for transient evolutions where the embedded protections (power limitation or thermal cycling during thermal shutdown) are not triggered.

5 Package and packing information

5.1 ECOPACK

In order to meet environmental requirements, ST offers these devices in different grades of ECOPACK packages, depending on their level of environmental compliance. ECOPACK specifications, grade definitions and product status are available at: www.st.com.
ECOPACK is an ST trademark.
