DESCRIPTION

The 74AC/ACT11898 high-performance CMOS devices combine very high speed and high output drive comparable to the most advanced TTL families.

The 74AC/ACT11898 10-bit Serial-In Parallel-Out Shift Register is an edge-triggered shift register with serial data entry and an output from each of the 10 stages. Data is entered serially through one of two inputs (A • B); either input

$$P_D = C_{PD} \times V_{CC}^2 \times f_I + \sum (C_L \times V_{CC}^2 \times f_O) \text{ where:}$$

f_I = input frequency in MHz, C_L = output load capacitance in pF,

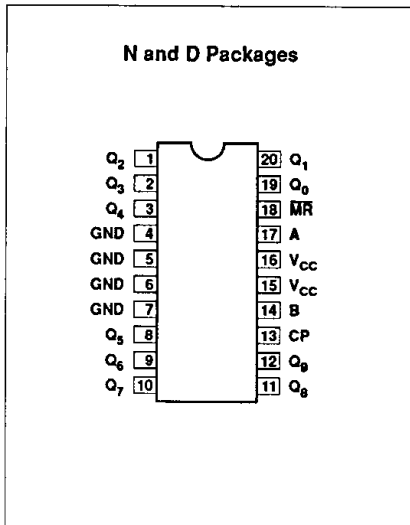

f_O = output frequency in MHz, V_{CC} = supply voltage in V,

$\sum (C_L \times V_{CC}^2 \times f_O)$ = sum of outputs

can be used as an active-High enable for data entry through the other input. Otherwise both inputs must be connected to the input data or an unused input must be tied High.

Data shifts one place to the right on each Low-to-High transition of the Clock (CP) input and enters the logical AND of the two inputs ($A \cdot B$) that existed one setup time before the rising clock edge

into Q_0 . A Low level on the Master Reset (\overline{MR}) input overrides all other inputs and clears the register asynchronously, forcing all outputs Low.

NOTES:

- Stresses beyond those listed may cause permanent damage to the device. These are stress ratings only and functional operation of the device at these or any other conditions beyond those indicated under "recommended operating conditions" is not implied. Exposure to absolute-maximum-rated conditions for extended periods may affect device reliability.
- The input and output voltage ratings may be exceeded if the input and output current ratings are observed.
