### Pin Configuration

### General Description

The AAT1011 is a 3-channel power supply supervisor with 8KV ESD protection. It provides Over Voltage Protection (OVP), Under Voltage Protection (UVP), and Power Good Indicator to monitor and control the output of the switching power supply system.

Remote function from external signal, *i.e.*, On/Off Control (ONCTL), is also implemented.

Over voltage fault protection and under voltage fault protection can be directly triggered without external voltage divider.

With a minimum number of external components, the AAT1011 offers a simple and cost effective solution. Meanwhile, it can greatly reduce the PCB board space for power supply system.

### FPO (Fault Protection Output)

NORMAL=“LOW”, FAULT=“HIGH”

FPO indicates the fault condition of either Over Voltage or Under Voltage. When a fault state occurs, the FPO latched high and combined with a low PGO output.

### PGO (Power Good Output)

NORMAL=“HIGH”, FAULT=“LOW”.

The Power Good signal will be issued with 300 ms delay after 3.3V, 5V, 12V and PGI are ready. Power Good Output should be low before the output voltage is out of regulation at turn-off.

### OVP and UVP

OVP monitors 3.3V, 5V, and 12V (via Vcc pin) UVP monitors 3.3V and 5V. OVP and UVP levels are determined by internal voltage dividers. The typical values are 3.9V, 6.1V, 13.8V for OVP and 2.83V, 4.3V for UVP, respectively.

### ONCTL (On/Off Control)

On/Off Control is used to reset the latched state of FPO and to externally control the switching power supply system with a 49 ms de-bounce time. AAT1011 offers 2.3 ms delay time after de-bounce to trigger FPO when ONCTL switches from low to high
