LX5503E

InGaP HBT 4 – 6GHz Power Amplifier

PRODUCTION DATA SHEET

DESCRIPTION

The LX5503E is a power amplifier optimized for high-efficiency low-power applications in the FCC Unlicensed National Information Infrastructure (U-NII) band, Europe HyperLAN2, and Japan WLAN in the 4.9-5.85GHz frequency range. The PA is implemented as a two-stage monolithic microwave integrated circuit (MMIC) with active bias and input/output pre-matching. The device is manufactured with an InGaP/GaAs Heterojunction Bipolar Transistor (HBT) IC process (MOCVD). It operates at a single supply of 3.3V with +26dBm of P1dB, and power gain of 21dB between 4.9-5.35GHz and 16dB up to 5.85GHz.

For +18dBm OFDM output power (64QAM, 54Mbps), the PA provides a very low EVM (Error Vector Magnitude) of 3%, and consumes 150mA total DC current.

The LX5503E is available in a 16-pin 3x3mm^2 micro-lead package (MLP). The compact footprint, low profile, and excellent thermal capability of the micro-lead package make the LX5503E an ideal solution for broadband, medium-gain power amplifier requirements for IEEE 802.11a, and HiperLAN2 portable WLAN applications.

FUNCTIONAL PIN DESCRIPTION

Name	Pin #	Description
RF IN	2, 3	RF input for the power amplifier. This pin is DC-shorted to GND but AC-coupled to the transistor base of the first stage.
VB1	6	Bias current control voltage for the first stage.
VB2	7	Bias current control voltage for the second stage. The VB2 pin can be connected with VB1 into a single reference voltage (Vref) through an external resistor bridge.
VCC	9	Supply voltage for the Bias reference and control circuits. This pin can be combined with both VC1 and VC2 pins, resulting in a single supply voltage (referred to as Vc).
RF OUT	10, 11	RF output for the power amplifier. This pin is AC-coupled and does not require a DC-blocking capacitor.
VC1	15	Power supply for first stage amplifier. The VC1 feedline should be terminated with a 220pF bypass capacitor as close to the device as possible, followed by a 1µF bypass capacitor at the supply side. This pin can be combined with VC2 and VCC pins, resulting in a single supply voltage (Vc).
VC2	14	Power supply for second stage amplifier. The VC2 feedline should be terminated with a 220pF bypass capacitor as close to the device as possible, followed by a 1µF bypass capacitor at the supply side. This pin can be combined with VC1 and VCC, resulting in a single supply voltage (Vc).
GND	Center Metal	The center metal base of the MLPQ package provides both DC/RF ground as well as heat sink for the power amplifier.
