GENERAL DESCRIPTION

The Am27S19 (32 words by 8 bits) is a Schottky TTL Programmable Read-Only Memory (PROM).

This device is available in three-state (Am27S19) output versions. These outputs are compatible with low-power Schottky bus standards capable of satisfying the requirements of a variety of microprogrammable controls, mapping

functions, code conversions, or logic replacements. Easy word depth expansion is facilitated by an active LOW output enable (\bar{G}).

This device is also available in a low-power version Am27LS19.

PIN DESCRIPTION

A₀ - A₄ Address Inputs

The 5-bit field presented at the address inputs selects one of 32 memory locations to be read from.

Q₀ - Q₇ Data Output Port

The outputs whose state represents the data read from the selected memory locations

\bar{G} Output Enable

Provides direct control of the Q output three-state buffers. Outputs disabled forces all open-collector outputs to an

OFF state and all three-state outputs to a floating or high-impedance state.

Enable = \bar{G}

Disable = G

V_{CC} Device Power Supply Pin

The most positive of the logic power supply pins.

GND Device Power Supply Pin

The most negative of the logic power supply pins.

FUNCTIONAL DESCRIPTION

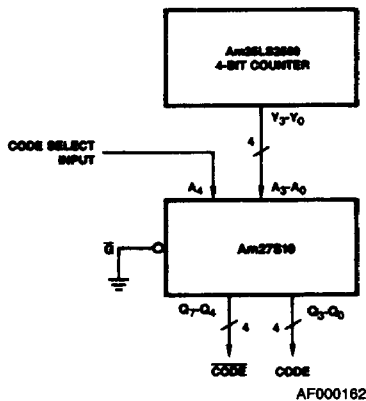

The Am27S19 PROM may be used as a code converter. Examples include conversion of hexadecimal, octal or BCD to seven segment display drive format. In many code conversion applications an extra PROM address input is available and may be used as a polarity control, blanking control or code

selector input. The use of a single Am27S19 to convert the outputs of a binary counter to either excess three or gray code format is illustrated below. In this case both codes are generated in true and complemented form simultaneously.

Notes: 1. This applies to three-state devices only.

2. V_{IL} and V_{IH} are input conditions of output tests and are not themselves directly tested. V_{IL} and V_{IH} are absolute voltages with respect to device ground and include all overshoots due to system and/or tester noise. Do not attempt to test these values without suitable equipment.

3. Not more than one output should be shorted at a time. Duration of the short circuit should not be more than one second.

4. These parameters are not 100% tested, but are evaluated at initial characterization and at any time the design is modified where capacitance may be affected.
